

## Inside storage space

---

waste

2 camping chairs  
camping table

Pictures can tell you more than a thousand words. Here are some examples how I made the most of the limited space in my Zebra. Each object has its dedicated place. This saves me quite some time from searching (although I do not stick to this principle all the time myself). When I was planning the inside storage I paid a lot of attention that 'life' inside my Zebra is still possible. That is one reason why I banned big and heavy stuff as well as drawer systems from the in-cabin room. However, apart from the permanent installed storage facilities, there is still enough room for sleeping bags, travelling bags or other miscellaneous.

buffer storage

Power tools  
various electronics

For all interior fittings I employed ,L'-profiles as used in frameworks for shelves. Cabinet doors and walls consist of impregnated 3 mm plywood that I have covered with industrial floor cover. Only the sink and the kitchen working surface is of stainless steel. This construction is light weighted but – through the use of ,L'-profiles - remains elastic enough to withstand vibration and warpage effects when driving on rough territory. Have a look.
